

Have you ever been diagnosed with lung cancer?

Do you want to help improve communication between lung cancer patients and health-care providers?

UCSF researchers are conducting a study to examine the usefulness of a “Mobile Health Tool for Lung Cancer” (mHealth TLC), a computer application that allows you to experience a virtual clinic visit and try to get the information you need to manage your lung cancer.

The study involves a 1 hour interview while using the mHealth TLC software and providing feedback about your experience.

The study takes place at UCSF Parnassus, and you will be provided with a \$20 gift card for your participation.
